

OKALUX functional glass with LED

OKALUX

Wir denken Architekturglas weiter.

Atmospheric depth effect and brilliant colours

OKACOLOR LEDs at the tram stop, Augsburg in cooperation with axis Nürnberg | Artist: Rita Kriege

OKALUX glazing with integrated LEDs creates fascinating light effects. The available configurations leave unlimited options for architects and interior designers. Almost any colour is available and different moods can be effectively realized. The light can be evenly dispersed across the entire face of the window or accentuated with graphic elements. LEDs can be applied in many ways: amongst other things, with partitions, dividing walls, signage, advertising space or as illuminating element. An additional advantage: LEDs distinguishing themselves through a minimum of electrical power consumption and a long service life.

In combination with different OKALUX products, e.g., capillary slabs or a brilliantly coloured OKACOLOR digital print, an unlimited number of variations is available. The result is a remarkable scope of colour temperature, structure or decor.
